

Gode Theory

The Gode Theory unifies all scientific theories from past, present and future from all the Universes, proving scientifically that God exists.

The scientific theories require the *infinite* value to make them correct, as infinite is an abstract concept in mathematics.

However, this value cannot be considered as possible, an infinite value for a dimension *makes all dimensions* to possible have this value.

But an infinite value can't be considered seriously, as our Universe is made by finite numbers, the most evident example being the matter.

Considering any theory of a Big Bang, the previous logic will apply to all Universes.

Just before a Big Bang, infinite energy, zero space and zero time existed.

Like infinite, null and minus infinite are also abstract conceptions, used in mathematics and in the scientific theories.

*I consider these values as **Gode constants**, required for a mitigation from abstract to practical and an unification for all the theories.*

Note that although the photon is considered of zero mass, this is an abstract value, there are no photons measured at zero velocity. More truthful is the concept that they have a relativistic mass – the mass of a moving object.

I give another example, Einstein's theory of relativity implies that for an object to reach light speed is necessary infinite acceleration for a finite period of time or finite acceleration for an infinite period of time. In both cases it's required infinite energy.

Finally, let's presume that with a future technology, a civilization can travel back in time. It can go to the *first* Big Bang and watch God? That happened an *infinite* number of years ago, when *infinite* energy and *infinite* time existed. That would mean time (travel) can be infinite, which contradicts the principles and laws mentioned at the beginning. The infinite number, an *abstract* concept in the real life, is **reserved for God**.
